Bittorrent

How to make torrents more secure.

To make things easier in Windows you can rename the TAP interface.

1. Open Control panel

2. Click on View network status and tasks

3. Click on change adapter settings

4. Right-click on the adapter that contains "TAP-Windows Adapter V9" and select rename and enter Mullvad.

5. Click on **Tools**

6. Click on **Options**

7. Click on **Advanced**

Q. Why don't you have instructions for other bittorrent clients like μTorrent, Vuze

or bitcomet ?

A. They are not open source, are adware, bundle junkware, or they just don't

have as good privacy settings as qBittorrent.
